

JOSHUA HIGGINS

Provo, UT | (801) 928-0187 | joshuamichaelhiggins@gmail.com | joshhiggins.dev

Senior-level Software Engineer with 9+ years of experience building full-stack web applications, specializing in fintech accounting integrations, micro-frontend architecture, and large-scale platform migrations. Proven track record of owning complex integration systems, improving setup experiences for customers, and driving measurable frontend performance improvements.

SKILLS

Languages & Frameworks: React, TypeScript, JavaScript (ES6+), Python / Django

Architecture: Micro-frontend (MFE) architecture, monolithic-to-modular migration, full-stack web development

Platforms & Tools: GraphQL, PostgreSQL, DataDog, Git, GitLab, Docker

Testing: Jest, React Testing Library

EXPERIENCE

BILL (Divvy) – Software Engineer, Remote

Sep 2021 - Jun 2026

- Owned and improved accounting software integrations (QuickBooks Online/Desktop, NetSuite, Sage Intacct, Acumatica, Rillet, and others) after the Divvy–BILL acquisition, cutting the time to get customers fully set up and ready to use their integrations from up to a full day down to 5 minutes–1 hour, depending on mapping complexity.
- Designed and built Mandalore, a micro-frontend proof of concept that extracted the accounting integrations codebase from a large monolithic repository and directly informed subsequent micro-frontend work that improved accounting integration setup flows.
- Built DataDog dashboards that tracked page-load performance, error rates, and key user flows. Used the dashboards to identify a slow-loading page, generate reports, create tickets, and ultimately fix the performance issue.
- Built the migration systems (global alerts, real-time progress indicators, and background processing) that enabled 100% of customers to switch from the legacy accounting integration setup flows to the new platform experience.
- Served as the primary frontend engineer for accounting integrations, partnering with product, backend, and platform teams. Reduced setup errors by 95%, significantly improving customer experience and decreasing the time the product team spent troubleshooting user setup issues.

Rakuten – Software Engineer, Cottonwood Heights, UT

Mar 2018 - Sep 2021

- Helped design and build the Insights and Analytics Portal (IAP), Rakuten Advertising's next-generation reporting platform that replaced the legacy system used by publishers and networks. Successfully migrated 100% of customers to the new platform.
- Built the Annotations feature that let users leave comments and hold threaded discussions directly on specific data points within analytics graphs – replacing the previous workflow of screenshotting charts and discussing them over email or Slack. Implemented the interactive visualization layer using custom D3.js charts to support this in-context collaboration.
- Created a Django-based migration tool that automated the transfer of user data and historical information from the legacy system to the new platform, saving product support weeks of time by enabling much faster user migrations when needed.

NICE inContact – Software Engineer, Sandy, UT

May 2017 - Mar 2018

- Developed an internal high-availability maintenance tool that allowed systems administrators to view the current active environment (server/database) and perform safe blue-green style switchovers between primary and secondary instances.
- Implemented the full failover process – spinning up the standby environment, validating readiness, and shutting down the previous one – with safeguards to prevent data loss and ensure seamless cutover across geographically distributed cloud locations.
- Built tooling that saved systems administrators hours on routine environment management tasks, allowing them to focus on higher-priority work during server and database migrations.

EDUCATION

Brigham Young University - Idaho – B.S., Computer Software Engineering

2015 - 2018
